

ADAPTIVE SECURITY AND AI TO PROTECT MOBILE ENDPOINTS

BlackBerry® Intelligent Security
Dynamically Adapts Security Policies Based on Situational Risk

In a Mobile World, It's Tough to Be Both Secure and Productive

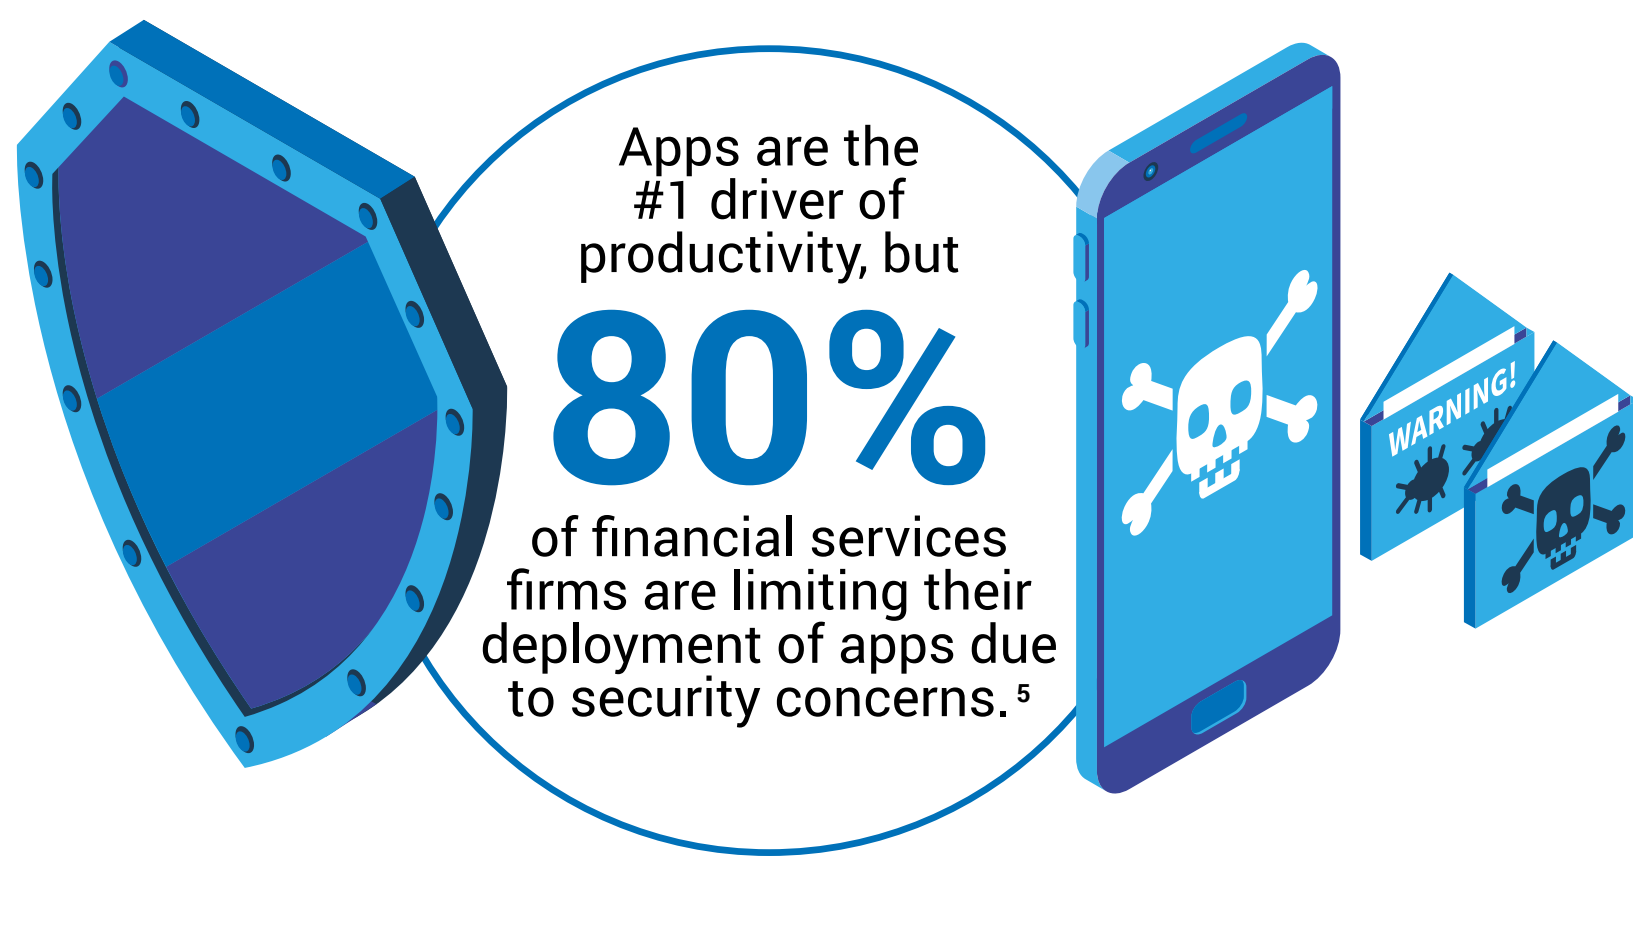

More employees are going mobile...

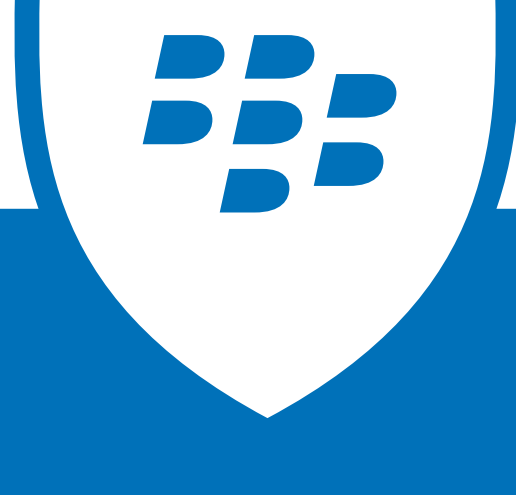

...making businesses more vulnerable to cyberattacks...

...and forcing a tradeoff between security and productivity

But Now You Can With

BlackBerry Intelligent Security

Leverage real-time risk scoring

Enhance end user experience and productivity without sacrificing security policies.

Grant access and issue authentication challenges based on real-time risk analysis.

Automatically adjust security policies based on situational risk.

Build trusted user-behavior models with BlackBerry artificial intelligence and machine learning technology.

So the more you use it, the smarter your security gets

Security levels are instantly adjusted based on changes to user location, past behavior, and the device or app being used.

Protecting Your People on the Move

When an international banker travels outside his country, device policies are dynamically adapted. Upon his return, in-country policies are automatically applied.

When a military officer enters a restricted zone, his camera and Bluetooth® connectivity are automatically disabled, while access to restricted information is enabled via secure browser.

Upon leaving the restricted zone, his camera and Bluetooth connectivity are automatically enabled, while access to restricted information is disabled.

Boosting Productivity

When a bank manager visits a branch office, her presence is detected, granting her easy access during her visit.

An office worker gets easy access when working inhouse. A low-risk, trusted location is detected, enabling simplified sign-on.

A first-time home user ramps up securely by performing multi-factor authentication, but is simpler due to location detection.

While Thwarting Attackers

When a geo-velocity violation is detected, which occurs when the system receives an input of time and place that couldn't possibly correspond with a worker's last legitimate connection, **the account is immediately put into a critical risk state, and the attacker is locked out.**

Intelligent Security That Enforces Security Policies with AI
